Graph Hacks: Context for AI Agents

POWERED BY FALKORDB

Agents are only as good as the context they work with. Give yours a graph: connected data it can reason over, a memory it keeps between sessions, and a clear picture of how things relate. Build an agent that makes decisions you can trace.

WHEN
Oct 15, 12:01 AM to Oct 18, 11:59 PM GMT+5:30

WHERE
Online, from anywhere

TEAMS
Solo or up to 4 people

PRIZES
$20,000 in total

7,811 REGISTERED

3JW3VS

aliens

1 of 4 seats filled.

You cannot change your team after you submit your project.

Looking for a team, or stuck on a graph model? The FalkorDB Discord is open for the whole event.

FALKORDB DISCORD ↗

01 / THE CHALLENGE

Give your agent the context to act

Build a working agent, or a group of agents, with FalkorDB as its context layer. The graph has to shape what the agent does, not sit on the side.

THE PROBLEM

Agents see pieces, not the whole picture. They lose track of what happened in earlier sessions, miss how people, systems, and records relate, and can't explain why they made a choice.

THE SHIFT

Put the agent's context in a graph. Data, memory, and company knowledge become nodes and edges the agent can follow, so it works from real relationships instead of guessing.

THE BRIEF

Build an agent that acts on connected data, remembers what it learns, and can show how it got to each answer.

WORK THE GRAPH HAS TO DO

- Follow connections across data
- Remember across sessions
- Share state between agents
- Connect people, projects, and decisions
- Show the path behind an answer

One agent problem

Pick a task where the answer depends on how things connect, and build the agent that handles it.

Solo or a team of four

Enter on your own or with up to three others. Register once, either way.

Open worldwide

Free to enter, online from anywhere, and no graph database experience needed.

Three tracks

Agents that act on connected data, agent memory and coordination, or company brain. Enter the one your idea fits.

02 / TRACKS

Three tracks

Build for one, or for all three at once. Each track has its own prize.

TRACK 01

Agents That Act on Connected Data

Build an agent that uses the graph to decide and act. It could investigate fraud, triage security findings, or work through a codebase.

KEY FOCUS

- Multi-hop reasoning
- Graph queries and algorithms as agent tools
- Tool selection through MCP
- Actions based on what the graph shows
- Explainable results

TRACK 02

Agent Memory and Coordination

Build agents that remember across sessions and share state with each other. Memory should persist, update over time, and be available to every agent that needs it.

KEY FOCUS

- Episodic, semantic, and procedural memory
- Persistent conversation history
- Shared state and handoffs between agents
- High-concurrency reads and writes
- Separate memory per user or tenant

TRACK 03

Company Brain

Build an agent that understands how a company works. Connect people, teams, projects, documents, and decisions in one graph, so the agent can answer questions and get work done across all of it.

KEY FOCUS

Knowledge from docs, tickets, and chats in one graph

Who owns what, and who knows what

Tracing decisions back to their source

Keeping knowledge current as things change

Answers with clear sources

PRIZE POOL

$20,000

One prize for each track, plus two side prizes. Every member of a winning team gets the prize.

AGENTS THAT ACT ON CONNECTED DATA

iPhone 18 Pro

For the best agent that uses a graph to make decisions and take action.

AGENT MEMORY AND COORDINATION

PS5 with GTA VI

For the best agents that remember across sessions and share what they know.

COMPANY BRAIN

M6 Mac Mini

For the best agent that understands how a company works and gets work done.

SIDE PRIZE

AirPods 5

1 WINNER

Best blog post

Write a blog post about your project. The best post wins a pair of AirPods 5.

SIDE PRIZE

T-shirt

TOP 50 PROJECTS

Top 50 submissions

Every member of the top 50 teams gets a t-shirt, shipped to their address.

03 / WHY GRAPHS

Agent questions are about connections

The hard questions agents get asked don't live in one record. The answer depends on how several things relate.

01

Which accounts are linked to this flagged transaction?

02

What did this customer ask for last month, and was it resolved?

03

Who on the team has worked on this system before?

04

What breaks if this service goes down?

→ A graph database stores those relationships directly, so the agent can follow them in one query instead of stitching records together on every step.

04 / ABOUT THE SPONSOR

Powered by FalkorDB

An open-source graph database built for AI agents.

FalkorDB

Traversals are fast enough to run on every step of an agent loop, and one instance can hold thousands of isolated graphs, so each user, agent, or tenant gets its own. Run it locally with Docker.

Get started in one line ↗

```
$ docker pull falkordb/falkordb:latest
```

OFFICIAL CLIENTS

PYTHON NODE.JS JAVA RUST GO PHP C#

CYPHER who knows about this system

```
MATCH (p:Person)-[:WORKED_ON]->(:Project)-[:USES]->(s:System {name: $system})
RETURN p.name AS person, count(*) AS projects
ORDER BY projects DESC
LIMIT 5
```

Context for AI agents

A graph your agent can read and write on every step, and still find on the next session.

Agent memory · Multi-agent state · Connected company knowledge

Connect your agent stack

Use FalkorDB through the framework or protocol you already build with.

GraphRAG-SDK · QueryWeaver · MCP · Graphiti · Cognee · LangChain · LlamaIndex

One graph per user or tenant

Leverage multigraph topology to create isolated graphs in a single instance, without running separate deployments.

Query with Cypher ↗

Create nodes and relationships, match patterns, follow paths, and return what your agent needs.

Graph algorithms as agent tools ↗

Traversals your agent can call instead of writing them itself.

Shortest path · PageRank · Centrality · Connected components · Community detection

Explore the graph

Use FalkorDB Browser to run queries, inspect the data model, and see how records connect.

05 / FAQ

Got questions?

When does the hackathon run?

Who can participate?

Do I need graph database experience?

Is FalkorDB mandatory?

Can I enter more than one track?

Where do I register?

Can I use any programming language?

Can I continue an existing project?

Can I use coding assistants?

Does the project need to be deployed?
